The invisible denture

Completion | Hands-on

The invisible denture

Full dentures which are not or only barely visible to others depend on the existing anatomical-physiological conditions. These data are obtained, among other things, with the help of facial analyses and denture measurements. The individual position of the anterior teeth of different dentition classes, phonetic aspects and the color characterization of the gingiva are applied to achieve a natural-looking result. We will elaborate on these topics using an upper and lower jaw anterior situation, from setup to individual completion.

Learning objectives

The participants will be able to identify existing issues and apply the knowledge acquired. The participants will be able to analyze the patient's situation and implement the individual data in efficient, systematic steps, from setup to completion.

Recommended experience

- › Expert >5 years

Format

- › Presence

Category

- › Advanced course

Topics

- › Determining denture data
- › Full denture orientation aids
- › Selection of anterior teeth
- › Posterior tooth setup
- › Individual shade characterization
- › Finishing

For

- › Dental technicians
- › Prosthodontists
- › Clinical dental technicians

Duration

2 Days
